Task: Demonstrate web server & DNS using PT.

Process:

1) Take a server, PC & switch, connect them & give IP addresses

2) server → services → DNS, give a website name which represents the IP address of the server.

3) Now go to the PC, PC → Desktop → cmd prompt
   → ping "websitename"

   PC → desktop → web browser, instead of typing the server's IP, type the name entered in DNS.

   If it opens & shows a web page, then it works.
